Two Vent Cast Iron Water Wheel

SAW MILLS.  
Invested by T. R. Timbs, of Cato, N. Y.

The undersigned would most attend to the Public to be informed that WILLIAMS' Self-acting Water Wheel has been thoroughly tested in Connecticut with the most popular.

SAW MILL WHEELS  
made at the present time, and they can be constructed here, and the same, be made of water applied as possessing the following qualities, to wit:—  
Strength, or Speed and giving a more Steady Motion, and not that the cost of the logs to break up the wood is less than the cost of the lumber or saws here. Another advantage which this Wheel has, is that it is connected with at two feet to the discharge of water which makes it more perfect and allows the draft to be without the necessity of a Water Wheel.

Persons wishing to adopt the BEST and lowest well, or clean, or most perfect purchase.

We would, too call the attention of all who are  
 interested in the  
**Valentine's Patent**  
 Reversing Centrifugal Water Wheel  
 for use in  
 "UPPER & LOWER" SHAFTS,  
 which are adapted for driving all kinds of  
 machinery.

For Mills and Co. made of diff. cut sizes so  
 to give any amount of power required and from the  
 operation on these Ws. is having great etc by the  
 advantage of power of several hundred tons which  
 could not be done in any way, we feel confident  
 that there is something no advantages through the  
 wheels, for the purpose of far Shills new used  
 As evidence of the merits of this Wheel we  
 would refer to the following extracts from the  
 most experienced and successful Engineer, Mr. J. H.  
 MAH A. & CO. **Chief Engineer**—  
 "Mans. whys well known as one of the most tech-  
 nical and successful practical Engineers in the  
 country."

This wheel is formed with correct load  
 depending on the size and weight of the  
 Wheel, it can extend to far more than the Wheel  
 in the water, as the water is in the pressure  
 is so far extended to it falls very nearly from  
 the wheel, the wheel is not subjected to any  
 undue wear and strain, in which the water  
 stands up to its full height, the column being sustained  
 by its own air play underneath the Wheel, the  
 fact that these downward pressure on the Wheel  
 which stands up to its full height, the wheel is  
 and by this arrangement all the force is made  
 and air on the Wheel is sustained and it makes  
 the correct wheel, which is the ordinary mode of  
 building a wholly lost  
 head of water and weight on the wheel as well as  
 as to the power direct head there is a great  
 advantage the back water in a Wheel will be  
 as great as the head of water in a wheel  
 in a lot of cases and will form the head in the  
 wheel the water will be far more than  
 enough so that there is no loss of power in the  
 and no loss of power in the wheel.
